

Samuel Dacanay

Staff Software Engineer and **Director of Engineering** with 12 years building high-throughput distributed systems and shipping enterprise infrastructure that runs inside customers' own data centers. Hires and leads backend teams; leads identity, release engineering, and supply-chain security work.

EXPERIENCE

NetBox Labs, Remote — *Staff Software Engineer, Tech Lead*

May 2026 - PRESENT

- **Chose and integrated Keycloak** as the identity layer for NetBox's new platform apps, wiring it to an in-house authorization server. Customers sign in with their own company accounts, a sign-in survives losing a node mid-login, and the same setup serves **SAML and LDAP** customers, not just OIDC.
- **Moved every install off ingress-nginx** onto **Traefik and the Gateway API**, updating the Helm chart, the Kubernetes operator, and the installer together so on-prem runs the same routing stack as the cloud product. Existing customers upgraded in place.
- **Made releases repeatable** with required checks, branch protection, and automation that shows evidence each gate passed, instead of trusting that someone remembered.
- **Standardized the team's Claude Code skills and workflows**: shared agents for scoping tickets, tracking release readiness, and on-call handoff, plus consistent automated review across the repos the team ships. **Pointed QA** at automated coverage and regression testing rather than a test plan per ticket.

Chainguard, Remote — *Staff Software Engineer*

May 2024 - April 2026

- **Built and maintained** the Java and JavaScript ecosystem rebuilders, delivering SLSA 3 provenance and SBOMs for **500k+ artifacts** across **44+ enterprise customers**. **Migrated** the Java rebuilder to Argo Workflows, automating **2000+ popular libraries**.
- **Built** LibCheck, shipped as **chainctl libraries verify** — a Go CLI that validates package provenance and compares customer images against Chainguard base images.

MixMode, Santa Barbara, CA — *Director of Engineering*

August 2022 - May 2024

- **Designed** a horizontally scalable network ingestion pipeline **deployed in Kubernetes** to sustain **100 Gb/sec**, and **hired and led** the senior Scala team that built it.
- **Built** the Helm chart and release process for the legacy product, **culminating in a \$20M contract** with a major government defense agency.

Anchore, Santa Barbara, CA — *Senior Software Engineer*

August 2020 - August 2022

- **Built** a Kubernetes-based inventory system using Go & Python, **enabling** Anchore's platform to **analyze thousands of deployed Docker images daily** and **reducing analysis time by 60+%**, then added OSCP report ingestion that **improved report processing speed by 70%**.

LogicMonitor, Santa Barbara, CA — *Lead Software Engineer*

June 2014 - August 2020 · earlier: Engineering Manager, Senior Software Engineer

- **Architected** a high-throughput distributed data ingestion pipeline with AWS EKS, Kafka, and Quarkus storing **over 2 million monitoring metrics daily**, **boosting data processing efficiency by 100%** while absorbing **20% growth in data volume** on less hardware.
- **Scaled** the engineering team **300% in 6 months** as Engineering Manager, **cutting time-to-effectiveness in half**. Previously led distributed Tomcat Java applications **deployed across AWS Kubernetes clusters in 3 time zones**, ensuring **99.99% uptime**.

SKILLS

Cloud Technologies &

Containerization: AWS (Expert), GCP (Expert), Docker/Kubernetes/Helm (Expert), Replicated/KOTS (Moderate)

Programming Languages: Java (Expert), Python (Expert), SQL (Expert), GoLang (Moderate), node.js (Moderate)

Database Technologies: MySQL, PostgreSQL (Expert), BigQuery, Elasticsearch (Moderate)

Devops & CI/CD: GHA, CircleCI, Gitlab, Bamboo, Terraform

AWARDS & LANGUAGES

Eagle Scout, LogicMonitor AllStar Award

English & Spanish

EDUCATION

University of California, Santa Barbara — *B.S. Computer Science*
